Report: 6
Report for 6
Scan Type: Brain - MRI (Contrast) , Report Time: 2014-06-05
Clinical History :
* It is ESSENTIAL to specify date for the Interval Exam and Urgent options:
Special Instructions: prior to clinic 08.02.14
Infection Risk: No
Clinical Details: Fibrous Meningioma grade I
Specific question to be answered: ?
PROGRESSION PRIOR TO RADIOTHERAPY
MRI brain without and with contrast
Comparison: 29/7/2013
There has been progression of the left posterior parafalcine meningioma. And this now measures 4.5 x 3.7 x 7.1 cm compared to 4.3 x 2.5 x 5.7 cm previously. The adjacent areas of signal change is similar.
As before, the lesion extends into the inferior portion of the supra sagittal sinus and there may be involvement of the straight sinus as well.
Just lateral to the dominant lesion, a small left temporo-occipital convexity meningioma has progressed now measuring 1 cm.
The anterior parafalcine meningioma has also progressed from 12 to 22 mm
the area of encephalomalacia in the right medial frontal lobe with evidence of haemosiderin staining is similar to previous
There is no hydrocephalus.
Impression: There has been progression of the multiple meningiomas as described, in particular of the left dominant posterior parafalcine parieto-occipitallesion
Reported by David Jones on 2014-06-05
